

**Client:** AdventureWorks

**Consultant:** Khai Ha

**Course:** IT420 – Business Intelligence

**Date:** December 2025

## **Executive Summary**

The AdventureworkDW2022 database offered structured data that was easy to use and implemented seamlessly into the PowerBI. It provided a modernized analytical environment that was current and offered executives many data insights that would support big decisions. Over the course of 10 weeks until this full BI delivery, the work that was experienced were auditing and cleaning data, designing staging and data warehouse that completes with star schema, implementing ETL pipelines. Working with SSMS, SSIS, SSRS, and then finally Power BI to develop dashboards filled with logistics that supports predictive analytics. This portfolio will summarize the work cycle that a data analysis would go through to generate a clean dashboard for AdventureworkDW2022.

It all started with the most common yet most crucial aspect of data, the data quality and its audit. This aspect of data analysis as it is the core of any kind of connection between tables. The audit reveals missing data, wrong formatting, and many other issues such as duplications. All these possible issues expose the portfolio to risks including mismatch joins, and erroneous aggregation of the data. It shows how important it is to clean the data through repeatable ETL. That's where the job of the Data Analysis begins, cleaning the data with ETL.

## **Week 1- Data Quality Assessment & Source Evaluation**

**Deliverables:** Data profiling worksheets, messy dataset assessment

Ha\_Khai\_Project1

### **Key Actions:**

In Week 1, I did a full data audit to ensure the quality of the data being provided. The files were of the messy Customer, Product, and Sales flat files. Going through the process the files source were evaluated as reliable, structurally consistent, and data integrity issues all over. The Customer file has missing data, invalid age, unknown gender values, and misspells cities. The Sales file has misaligned dates, negative quantities, invalid placeholder IDs (e.g., CustomerID 99999), and non-numeric values in TotalAmount. The Product file contains missing suppliers, missing prices, and duplicated rows. SQL server detected many issues during importation attempts, with improper data typings. This first assessment was the start of ETL cleanup for later, catching errors to prevent misinformation for reporting.

## Evidence:

1	CustomerID	FirstName	LastName	Gender	Age	City	State	Segment
2	1001	Michael	Lopez	F	33	Tacoma	WA	Retail
3	1002	Michael	Thompson	M	55	Bellevue	WA	Retail

## Week 2 - ETL Foundations & Data Cleaning

**Deliverables:** SSIS ETL package, cleaned CSV outputs

Ha\_Khai\_Project2Reflection

### Key Actions:

SSIS to build a complete ETL pipeline that filters out and corrects the bad data.

The software allows the data analyst to filter out and correct missing data with mock tempt values so SSMS would accept the import. Invalid gender entries by converting “O” to “Missing Value,” corrected city names through suffix parsing and proper capitalization, and normalized all State abbreviations. Any inconsistencies and spelling issues were caught and managed through SSIS “Missing Segment.” The SSIS flows used derived columns, conditional logic, data conversions, and sequential transformations to produce fully cleaned outputs ready for staging.

### Evidence:

## **Week 3 - Warehouse Schema Build & ETL Expansion**

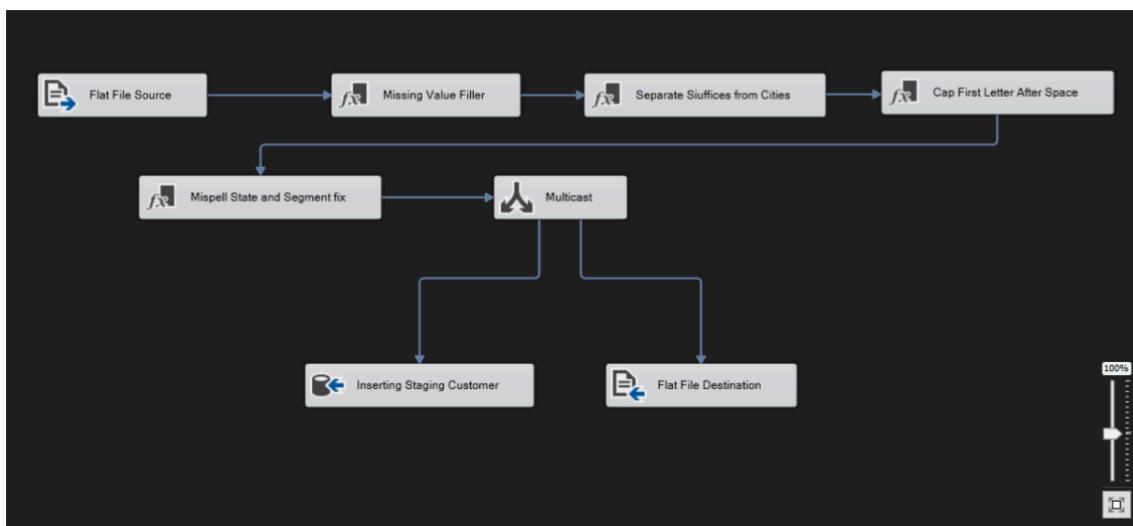

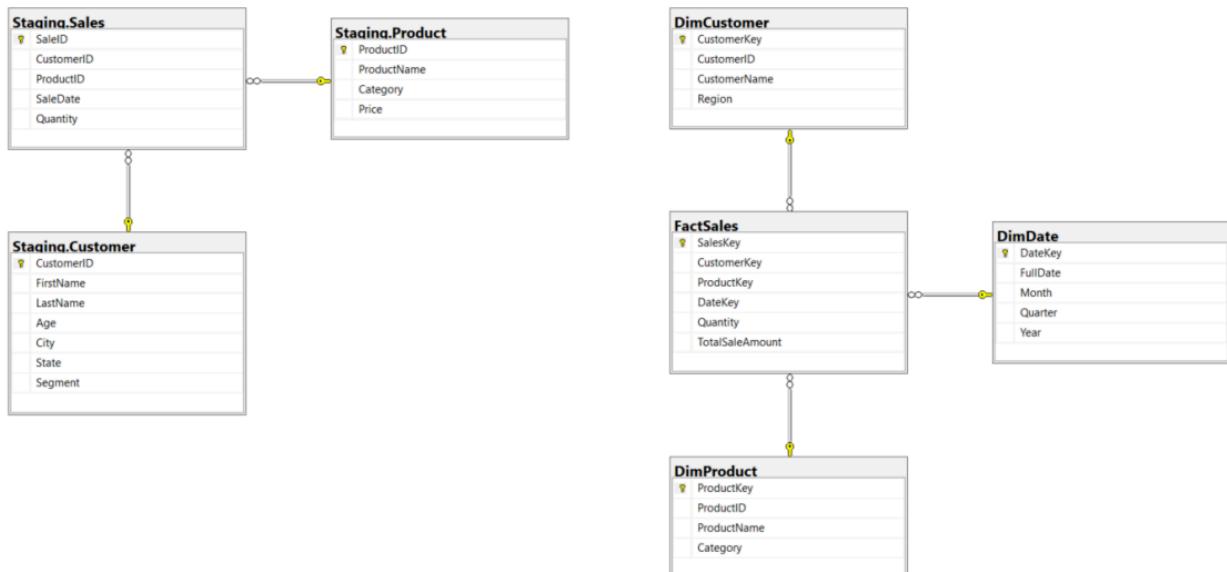

**Deliverables:** Dimensional model (DimCustomer, DimProduct, DimDate, FactSales), extended SSIS pipeline

Ha\_Khai\_Project3

### **Key Actions:**

Warehouse star schema was created by expanding the SSIS package from load staging into final dim/fact tables. With the creation of the ClientWarehouse database, planning of staging structure and final dim and fact table structure begin. Leading to the creation of DimCustomer, DimProduct, DimDate, and FactSales using surrogate keys, constraints, and business rules of  $\text{Quantity} \geq 0$ . SSIS's pipeline was extended with Multi cast components to ensure clean CSVs while inserting into SSMS. SSIS software made it easier to handle data conversion without restructuring work. The lookup feature of SSIS give the data analysis an easy way to catch and filter out duplication without causing more issues. It looks into the requested table, analysis provides filter parameters, any duplication of data is filtered out before insertion.

## Evidence:

## **Week 4 - OLTP vs. OLAP Performance Comparison**

**Deliverables:** OLTP vs OLAP comparison report

IT420 Wk4 proj4 report

**Key Actions:**

Week 4 OLTP staging and OLAP dimensional table, shows the importance of interaction within the system is not meant for executive reporting. The whole process going from one to the other is messy and fill with walls and walls of data. It's a big factor that hinders speed for executives when they want fast, easy info to look through and present. Tests were created to show the difference in speed of OLTP and OLAP. It shows that OLAP returns results much faster, and works better mid-meeting presentations as queries and reports can be built in minutes without causing major issues for the technical infrastructure of the business. This is due to the difference between OLTP and OLAP as they are made and built for different things. OLTP was created with real time transaction integrity, while OLAP was optimized for aggregation, business intelligence, and fast scanning. OLAP for BI to ensure reliable, scalable performance.

**Evidence:**

## **Week 5 - SSRS Static Reporting (Tabular & Chart Reports)**

**Deliverables:** SSRS Report – Total Revenue by Category, Top 10 Products by Revenue

IT420 Week5 Project SSRS Report...

### **Key Actions:**

Two SSRS reports were made for executives in a tabular report summarizing Total Revenue by Category and a bar chart showing Top 10 Products by Revenue. The category report showed Electronics as highest performing category, while the Top 10 chart revealed Panasonic as a leading brand in multiple products. This information provides the executives clear information that they can use to make big decisions that can influence how the business does in the future.

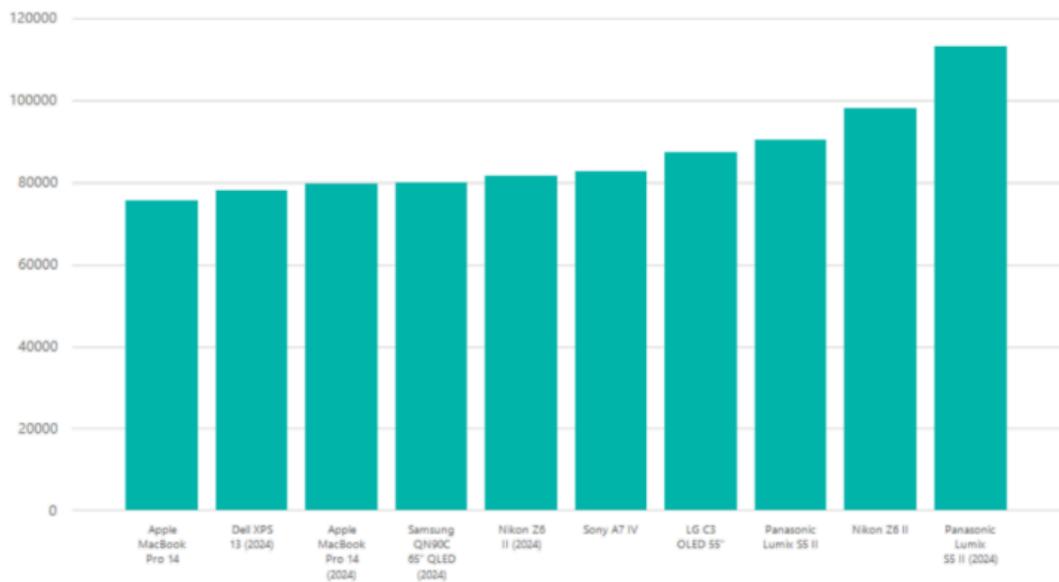

**Evidence:**

## Executive\_Report\_Tabular

Category	Total Qty	Total Revenue
Electronics	2798	2550314.23
Home Decor	2987	912393.07
Cosmetic	2102	38047.98
Health	2609	30622.51
Groceries	2957	16599.21

***Total Revenue by Category***

***Top 10 Products by Revenue***

***Top 10 Products by Revenue Chart***

## Week 6 - SSRS Interactive Reporting Enhancements

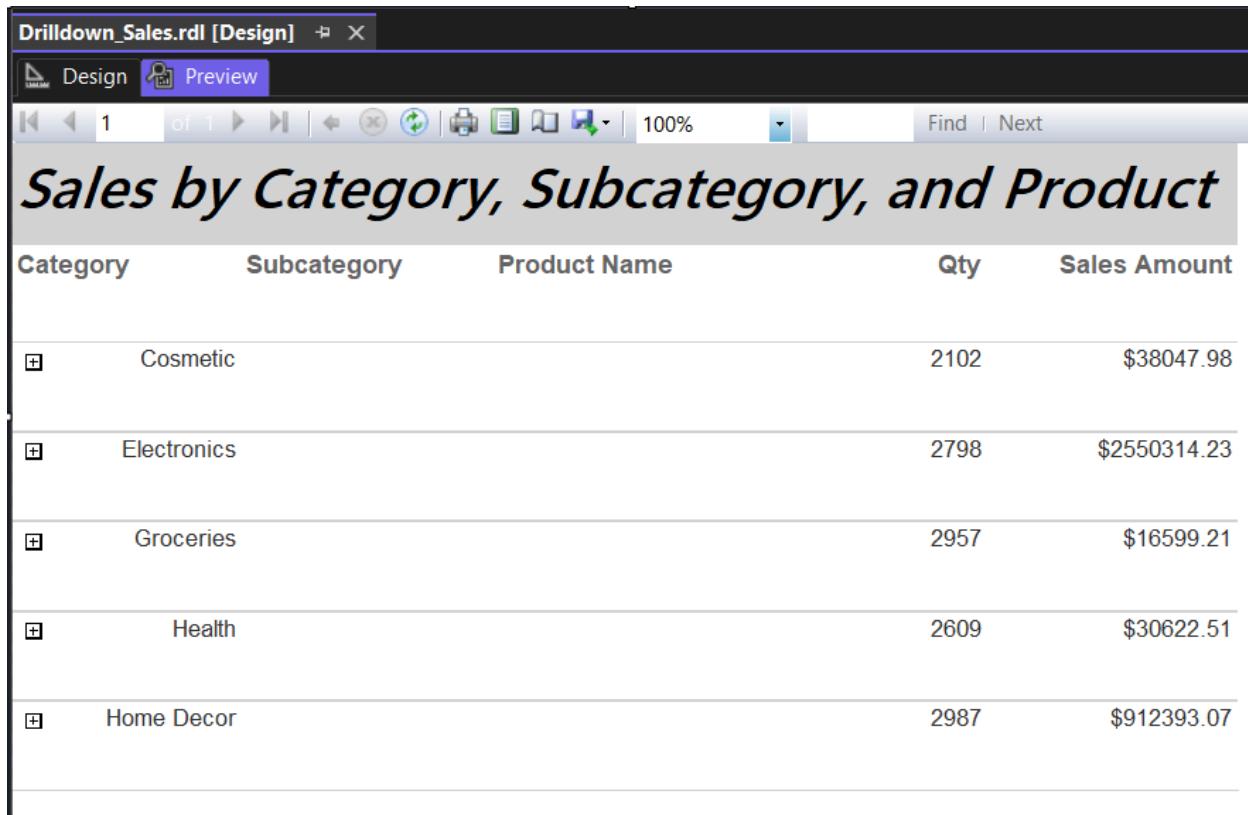

**Deliverables:** Interactive SSRS report with drill-down + date filters

IT420 Wk 6 Project SSRS Reflect...

### Key Actions:

The SSRS also offers drill-down interactions and a date-range parameter that allows executives to explore categories and products scope to what they want to see, making the report more user friendly and visually less clutter. This makes it so that a data analyst won't have to constantly generate reports as requested, they can provide features and notes for executives to scope into what they need to present their point.

### Evidence:

The screenshot shows the Microsoft Report Designer interface with the title "Drilldown\_Sales.rdl [Design]". The report is titled "Sales by Category, Subcategory, and Product". The table has columns: Category, Subcategory, Product Name, Qty, and Sales Amount. The data is as follows:

Category	Subcategory	Product Name	Qty	Sales Amount
+	Cosmetic		2102	\$38047.98
+	Electronics		2798	\$2550314.23
+	Groceries		2957	\$16599.21
+	Health		2609	\$30622.51
+	Home Decor		2987	\$912393.07

**Drilldown\_Sales.rdl [Design]**

# Week 7 - Power BI Executive Dashboard

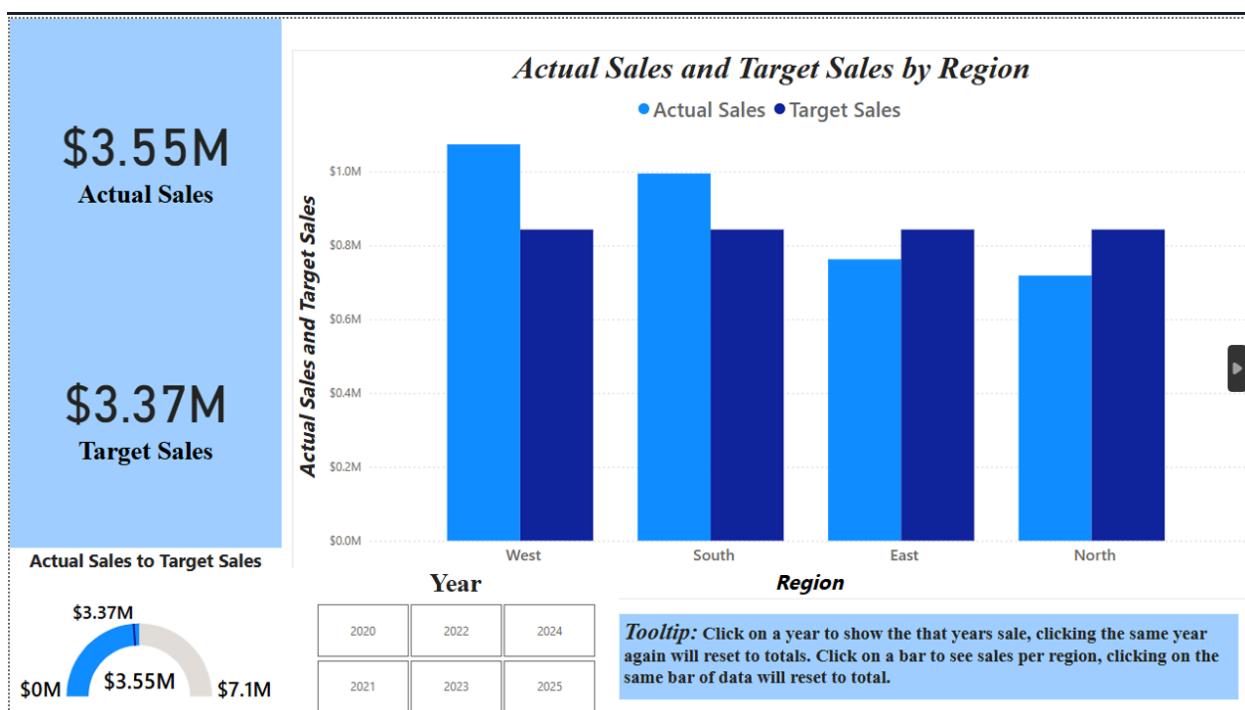

**Deliverables:** Multi-visual executive dashboard with slicers and interactions

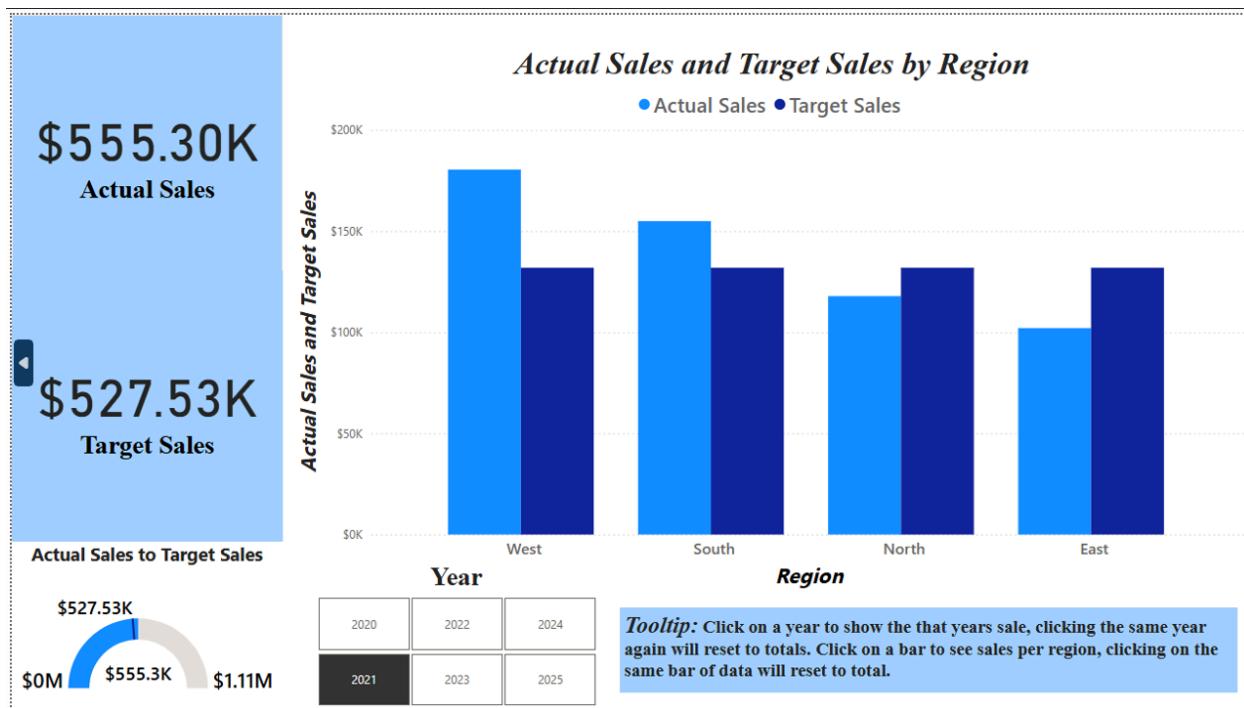

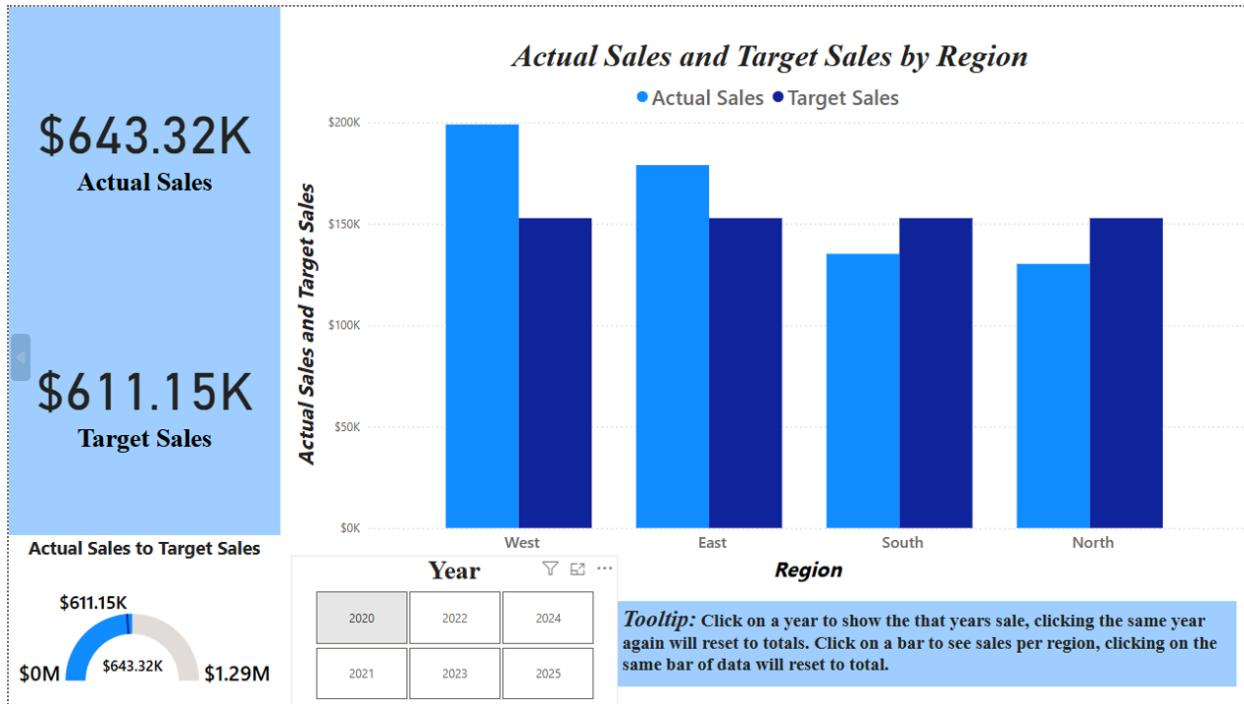

IT420 Wk 7 Project Power BI Exe...

## Key Actions:

Week 7 Power BI dashboard featuring KPI cards for Actual and Target Sales are finally in use, a gauge that visualizes performance toward the target, and a clustered bar chart comparing actual vs. target sales by region. A year slicer gives the option for fast time-based filtering, and all visuals are dynamically changing to adjust and show what's being selected. A tooltip was added to guide users through the interactive dashboards. These features make the whole dashboard cleaner and ready to use, making non data analysts a data expert themselves.

## Evidence:

# Week 8 - Storytelling Dashboard

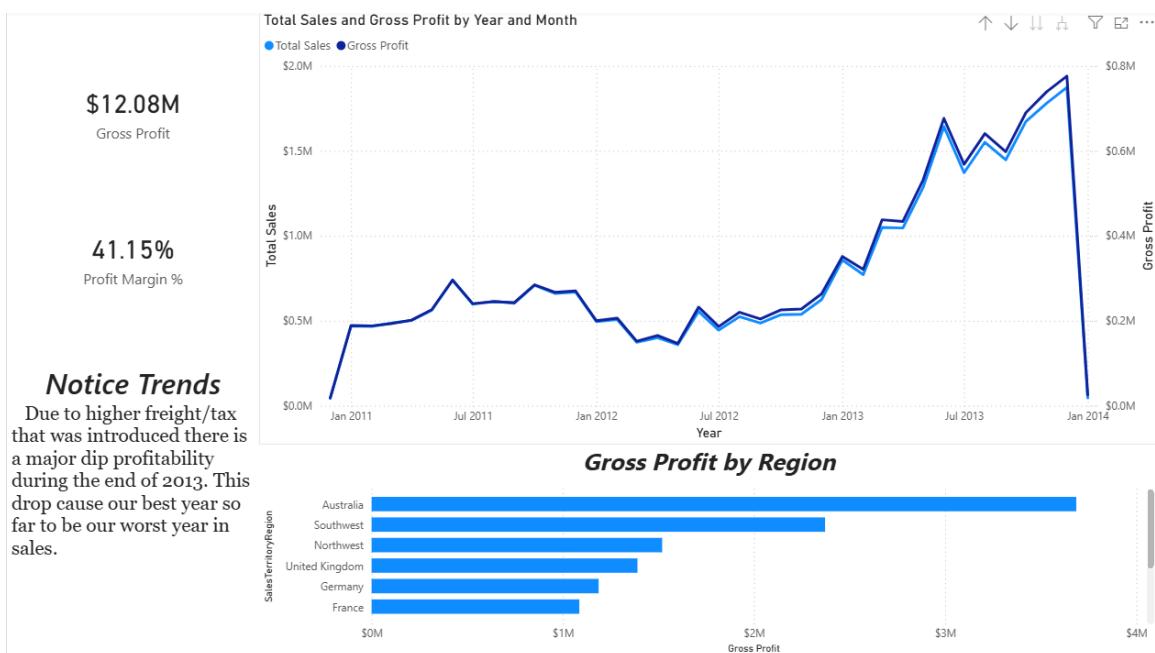

**Deliverables:** Power BI storytelling dashboard

IT420 Wk8 Project Reflection

## Key Actions:

Week 8, the storytelling-driven dashboard emphasizing profitability, one of the most important financial indicators for real-world businesses. The dashboard includes Gross Profit and Profit Margin KPI cards, a centered line chart showing Total Sales by month across years, and a clustered bar chart displaying Gross Profit by country. Visual design choices, such as contrasting but harmonious line colors, centered titles and legends, and a prominently placed annotation help guide the narrative. The annotation describes a mock factor explaining a sales dip in late 2013, demonstrating how contextual storytelling can enrich executive insights.

## Evidence:

## **Week 9 - Executive Decision Support Dashboard (Multi-Page)**

**Deliverables:** Power BI multi-page executive dashboard

IT420 Wk 9 Project Executive De...

**Key Actions:**

Week 9 expanded the dashboard into a multi-page Executive Decision Support system featuring four executive-level KPIs(Total Sales, Total Orders, Total Resellers, and Average Lead Time). The homepage serves as a navigation hub, linking to pages such as Orders Over Time, Operations by Territory, and Product Category Performance. Orders Over Time reveals yearly performance trends. Operations by Territory highlights regional strengths and weaknesses, Product Category insights indicate which products to expand or discontinue. These are valuable information as these can help executives negotiate with imports, and supply chains.

# **Week 10 - Predictive Insights Dashboard (Clustering & Classification)**

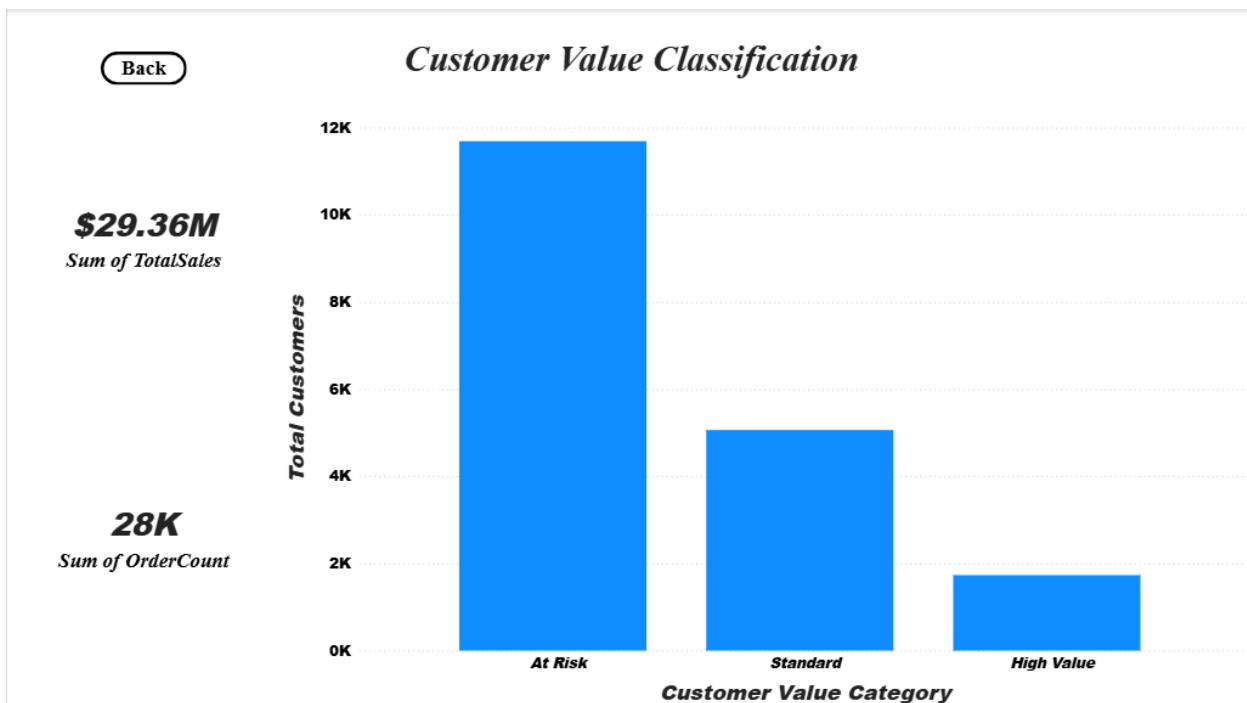

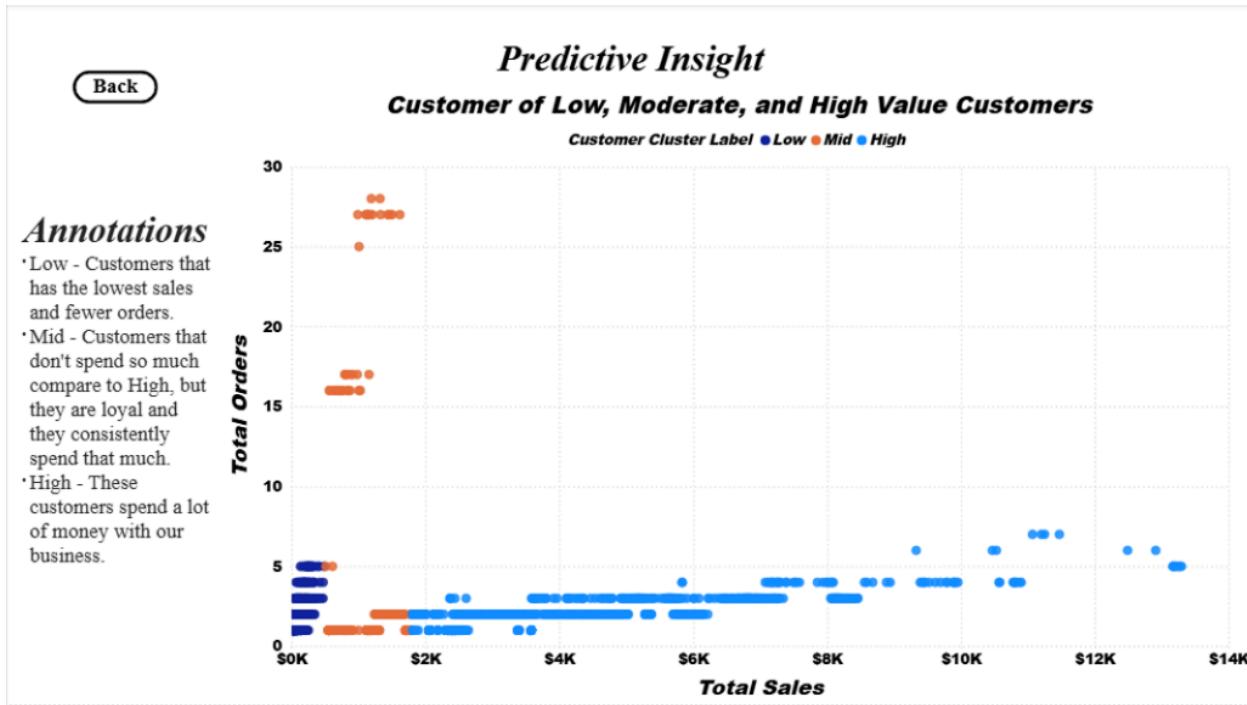

**Deliverables:** Predictive analytics enhancement to the Executive Dashboard

IT420 Project Wk 10 Memo

## **Key Actions:**

Week 10 integrated predictive analytics into the dashboard using customer clustering and classification models. Clustering grouped customers into Low Value, Mid Value, and High Value segments using Total Sales and Total Orders to illustrate customer engagement and revenue contribution patterns. Classification categorized customers as At Risk, Standard, or High Value, allowing executives to quickly identify retention priorities and growth opportunities. Strategic recommendations included protecting High Value customers, re-engaging At Risk customers due to their potential impact, and growing Standard customers through upselling and cross-selling. These predictive pages transformed the dashboard from descriptive to forward-looking, equipping executives with an analytical tool for strategic decision-making.

## Evidence:

## **Final Recommendations for the Client**

1. **Data Audit:** Data was analyzed, filtered and clean to ensure quality data for display.
2. **Implemented ETL pipelines:** To refresh the warehouse daily or hourly to business needs.
3. **Expand predictive analytics:** Prep to support churn prevention, demand forecasting, and inventory optimization.

**Develop standardized KPIs:** to ensure consistency across departments.

**Promote easy to use interactive dashboard BI:** using Power BI dashboards to reduce dependency on IT for routine reporting.

## **Reflection on Professional Growth**

Over the course of weeks building up to this final submission, I learn to endure and be independent. In a professional setting I'll be all alone with competitors for help. It's nice in a professional setting that data analysts are paid to handle these situations.

The 10 weeks offered me time to strengthen my comfortability with SSMS, while learning new exciting software for business intelligence. The process of going from raw data to something presentable is quite simple, logic and concepts are there. The unfamiliarity with a new ui without a tutorial lead to challenges of time spent searching through live resources to just find the proper method to achieve the result required by the assignment.

Provided software such SSMS, SSIS, SSRS, and PowerBI works together very well. SSIS taught me how to design efficiency resilient ETL pipelines using lookups, derived columns, conditional splits, and data conversions. Building a star schema gives a better visual on how dimensional modeling and why OLAP structures outperform OLTP for workloads. Developing SSRS reports helped me appreciate detail and clarity, while Power BI dashboards pushed for understanding integrating visual and data into a storytelling, and user-centric design. Adding predictive insights in Week 10 expanded my toolkit into data science concepts.
